Ara Nazarian, DDS, DICOI, believes the CS 3600 is an integral part of the implant workflow.

“The CS 3600 scanner is a great addition to implant workflow. Once the edentulous areas and teeth are scanned, they can be combined with the CBCT scan in the Prosthetic-Driven Implant Planning module, which allows you to get a more holistic view of the patient’s dental situation. Next, you can work with your preferred surgical guide company to get an accurate guide made, without the challenges that come with traditional impressions and stone models. We find that not only does it help in the diagnosis, but also in executing and placing the implant.”
