

ePayment V1 version 3.1.17.9 Upgrade Installer Documentation

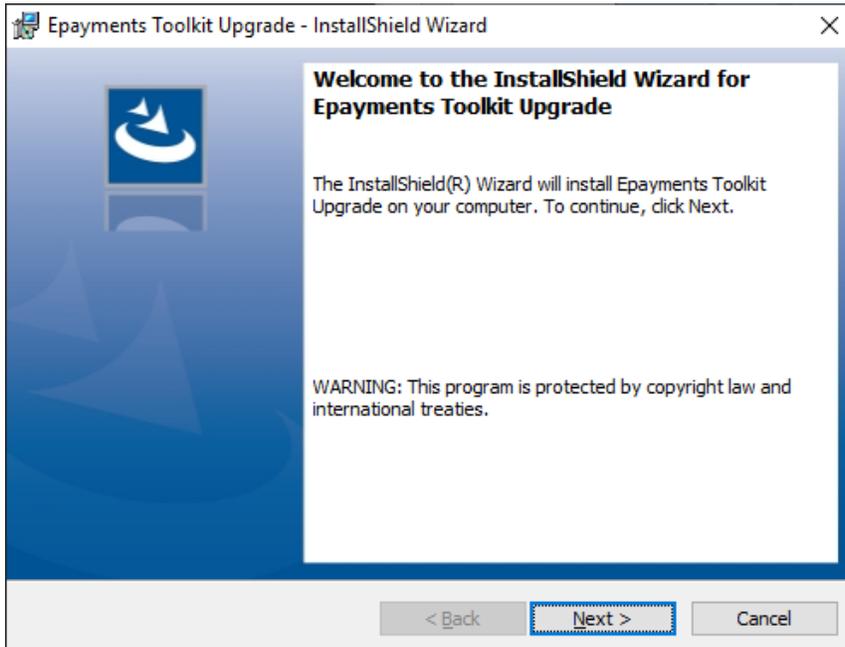

The ePayment V1 version 3.1.17.9 Upgrade installer will update the current files used by ePayments v1 to the newest version of ePayments v1 toolkit which is version 3.1.17.9

These files should all be located within the customers DPMS install directory. Unfortunately, because the customer has the option to change the install directory there is no one default path we can use.

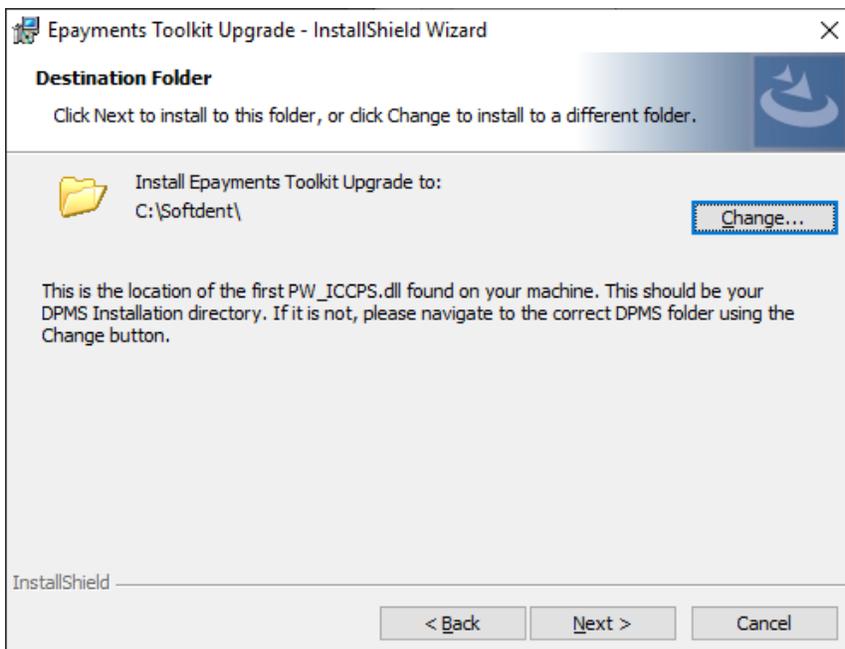

The installer will look for the install location of the DPMS by looking for the PW_ICCPS.dll file on the user's system. One issue with this way of doing the installer is that it will select the first location this file is found. This file should not be in any other location than the DPMS install location, however if the installer selects the wrong install location it can be changed.

Ideally before the installer is ran the customer would exit the DPMS to prevent any files associated with conversion that will be updated from being opened and locked, this could cause the installer to fail. Please contact Embedded Services Team with any issues with the installer.

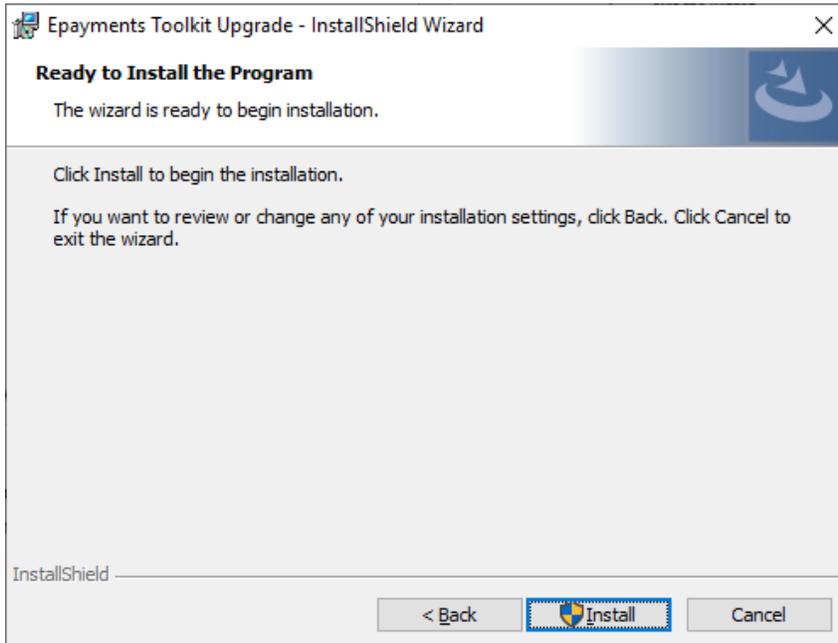

Launching the installer, it will unpack files and scan the computer for the dll. Once that is complete it will display this dialog, you can click next to continue.

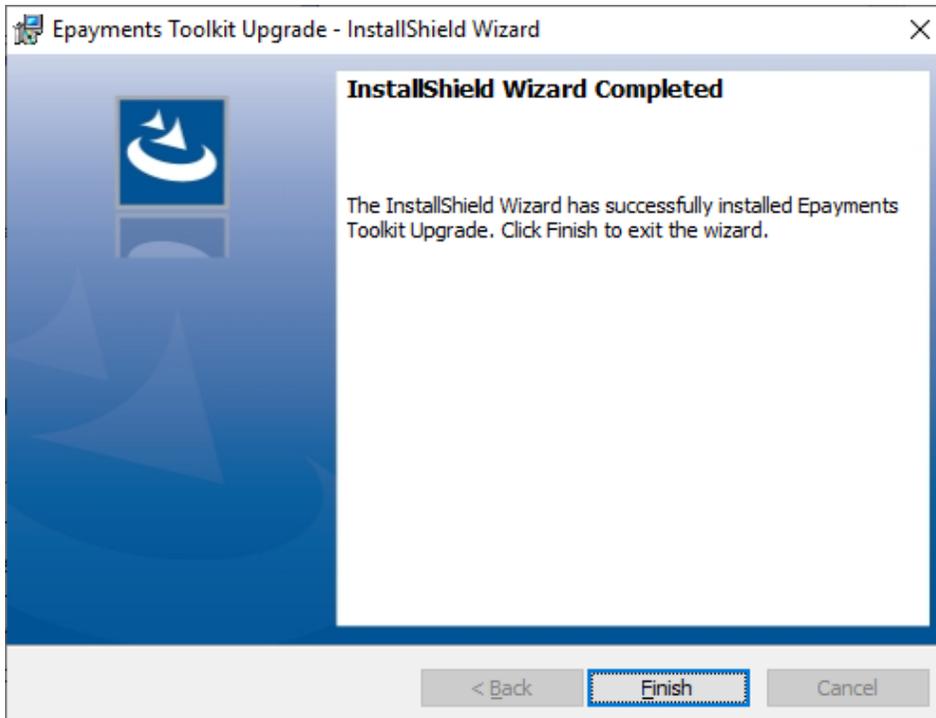

The dialog shows the directory that is currently selected that the PW_ICCPS.dll was found in. If this needs to be change you can click the change button and a folder browser dialog will be displayed to change the location of the install dir. If you must change the install dir please verify that the directory you select is the one with the PW_ICCPS.dll file in it. It should be within the directory the DPMS is installed at, each DPMS stores the files in a different location but it will be within the main DPMS install location.

Clicking next will display the last page before the install process is started. Click Install to run the installer.

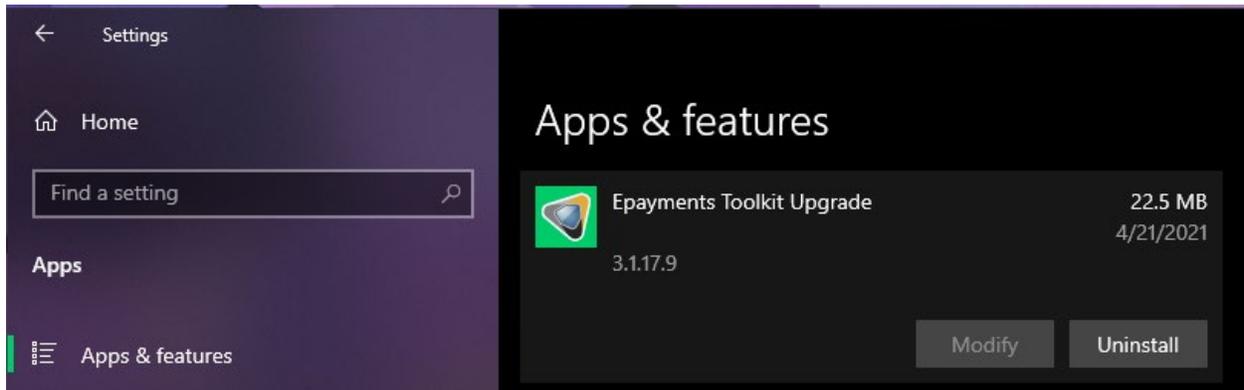

Once the installer completes this screen will be shown, click finish to close the installer.

Once the installer finishes navigate to the DPMS install directory and find the PW_ICCPS.dll file and right click on it select properties and then details to verify the installer copied over the correct files by verifying it is the correct version of the file which should be 3.1.17.9.

To check if the installer was run you can look at the file version of the PW_ICCPS.dll or check the installed Apps for Epayments Toolkit Upgrade, which will also have the version number listed.

[Updating a toolkit that had an installer run previously](#)

If the customer has had an update installer ran for a previous versions of the ePayment Toolkit they do not need to uninstall the old one first. The installer should recognize that there are newer files and it should update all files in the installed DPMS directory with the new files.

If it does not the original toolkit updater can be uninstalled, and the new version installed, and it should lay down the new files.
